Package ‘ThreeGroups’

September 10, 2015

Version 0.21
Date 2015-09-09
Title ML Estimator for Baseline-Placebo-Treatment (Three-Group) Experiments
Author Holger L. Kern [aut]
Maintainer Holger L. Kern <hkern@fsu.edu>
Description Implements the Maximum Likelihood estimator for baseline, placebo, and treatment groups (three-group) experiments with non-compliance proposed by Gerber, Green, Kaplan, and Kern (2010).
License GPL-2

Description

This package implements the Maximum Likelihood estimator for baseline, placebo, and treatment groups (three-group) experiments with non-compliance proposed by Gerber, Green, Kaplan, and Kern (2010).

Details
Package: ThreeGroups
Type: Package
Version: 0.21
Date: 2015-09-09
License: GPL-2
LazyLoad: yes

References

Description
This package implements the Maximum Likelihood estimator for baseline, placebo, and treatment groups (three-group) experiments with non-compliance proposed by Gerber, Green, Kaplan, and Kern (2010).

Usage
ThreeG(data, starting = NULL)

Arguments
data a numeric vector or list of length 10, containing the data in the form of counts: the number of successes (observations with \( Y = 1 \)) in the baseline group (s_b), the number of failures (observations with \( Y = 0 \)) in the baseline group (f_b), the number of successes in the treatment group among compliers (s_t_c), the number of failures in the treatment group among compliers (f_t_c), the number of successes in the treatment group among non-compliers (s_t_nc), the number of failures in the treatment group among non-compliers (f_t_nc), the number of successes in the placebo group among compliers (s_p_c), the number of failures in the placebo group among compliers (f_p_c), the number of successes in the placebo group among non-compliers (s_p_nc), the number of failures in the placebo group among non-compliers (f_p_nc).

starting a numeric vector of length 4, containing starting values for the 4 parameters to be estimated. If missing, suitable starting values are generated internally.
Details

The data, whether given as a list or a numeric vector, must be sorted in the order given above, i.e., 
(s_b), (f_b), .... (f_p_nc).
In most cases there should be no need to specify starting values.
Note that the notation used here is slightly different from that presented in section 3.3 of Gerber, 
Green, Kaplan, and Kern (2010).

Please contact the maintainer of this package with questions related to this package and the corre-
sponding author of the article (Alan Gerber, alan.gerber@yale.edu) with questions related to 
the article.

Value

ThreeG() returns a list with the following components:

starting contains the starting values used by optim().
est a 4x2 matrix containing estimates (first column) and standard errors (second 
column) of the proportion of compliers (row 1), the probability of success given 
treatment for compliers (row 2), the probability of success for non-compliers 
(row 3), and the complier average treatment effect (row 4).

optim.out a list containing the output from optim(), including the Hessian.

Examples

# This example replicates the empirical analysis presented in 
# Gerber, Green, Kaplan, and Kern (2010), Table 5, first column. 
# input data
sstat <- list(
s_b = 51766,
f_b = 253182,

s_t_c = 858,
f_t_c = 3128,

s_t_nc = 650,
f_t_nc = 3812,

s_p_c = 752,
f_p_c = 3154,
s_p_nc = 672,
f_p_nc = 3779

# let's estimate the complier average treatment effect
out <- ThreeG(sstat)
